The China-Pakistan financial hall CPEC is a very essential mission of China's Belt and avenue assignment (BRI), it goals to decorate connectivity and monetary cooperation between China and Pakistan. It became initiated in 2015, it includes infrastructure, power, and industrial projects. It has numerous key additives consist of highways, railways, and the improvement of Gwadar Port. CPEC ambitions to improve Pakistan's infrastructure, decorate electricity production, and create monetary possibilities whilst offering China with a shorter exchange course to the middle East and Africa. Although geopolitical and financial challenges, CPEC remains a very important of China and Pakistani relations, fostering regional trade and development. Throughout my research I measured several indicators such as social media usage, misinformation, public trust and the use of free digital services that influence public perception on CPEC. I collected 300 responses from students of university of Sargodha, Pakistan through closed ended questionnaire survey. Their responses played an important role to understand the real time scenario.

1. Introduction

China-Pakistan financial hall is a community of regional connectivity. apart from China and Pakistan; CPEC will have a fantastic ripple effect on Iran, Afghanistan, valuable Asian Republic and the location (Ali, 2019). The development of geographical linkages with improved road, rail and air transport gadget and extended and unfastened drift of both increase and people contact for enhancements on knowledge via educational, cultural and regional know-how and subculture. activity in better glide of alternate and groups creating, circulating and passing electricity with extra most appropriate agencies and synergy from win-win model will cause linked, included vicinity of commonplace future, concord and development. China Pakistan economic corridor is an initiative for regional advent in the world of globalized alternate. It set up peace, improvement, and win-win version of they all. China Pakistan economic hall is the wish for the better location of destiny with peace development and economic system boom (Akhtar, 2025).

Inside the phrases of President Xi of China, the 'China's Belt and avenue Initiative BRI ought to be inexperienced and sustainable' (Goh & Cadell, 2019), but, in step with other researchers and commentators, the mission is likely to purpose environmental damage (Horvath, 2019). The challenge supports its player nations alongside car bon-extensive growth pathways that are probably to enhance weather risks (Jun & Simon, 2019), which can also 'tip the arena into cat as trophic climate change' (Hilton, 2019, para 5). round 240 coal fired power plant life are being operated inside the 25 BRI international locations with the contribution of Chinese businesses. China may have commenced to de-couple from coal energy locally, but 'its coal and energy corporations are on a building spree distant place. it's miles clean that the specific infrastructure additives of the BRI projects will cause vast increments in emissions, loss of biodiversity together with other sorts of pollution. though, media reviews at the BRI tend to attention on its financial blessings and to play down or ignore its environmental cost (Saleem et al.,2018).

1.1 Research Objectives

RO 1: To determine how Pakistani public perceives information about CPEC on social media.

RO 2: To explore the core reasons for disseminating the fake news about CPEC.

RO 3: To determine long term cognitive effects about social media information.

1.2 Research Questions

RQ 1: How consistent exposure to social media apps influencing public perception about CPEC?

RQ 2: How public trust is being addicted to social media information?

RQ 3: How security concerns are increased by relying on social media information?

2. Literature Review

Over the time, growing international locations have exploited their herbal useful resource based on better degree of prosperity and economics boom achieved (Resnick et al., 2012). The manner wherein the media in those nations record, analyses and present the

improvement procedure is an crucial factor in their social constriction. For massive infrastructure tasks consisting of CPEC, this method of information media is vital due to the fact degrees and tone of insurance remember with reference to the media's impact on their audiences and in growing the proper situations for economic development (Gavitt, 1971).

The quilt age of the BRI mega-task has acquired widespread scholarly interest, inside the US, Indian and Chinese language media (Jan et al., 2018), and Russian media (Kuteleva & Vasiliev, 2020), as well as in ecu and Chinese media (Arifin et al., 2019). The Chinese language and Pakistani media: media insurance of CPEC (Yousaf et al., 2018), Indian and Afghan: media coverage of CPEC (Aslam et al., 2020), US, Indian and chinese language media: coverage of CPEC (Hameed & Shahzad, 2020) have been studied.

The CPEC is one of the six BRI corridors and is popularly perceived as a street map to financial integration and regional connectivity. it'll connect Kashghar in China to Gwadar, Pakistan, that's over 2000 kilometers away, and could permit China to access the Ara Bian Sea so that it will growth China's have an impact on within the vicinity (Abid & Ashfaq, 2015). In line with (Qusien & Robbins, 2022) the insurance of the China–Pakistan economic hall (CPEC) in the Pakistani media, with emphasis at the manner the venture is framed in the media in a growing united states . To cope with the research query 'How is the China Pakistan monetary corridor framed inside the Pakistani media? They reviewed coverage of the mega-venture in six Pakistani newspaper. we've got selected three Urdu newspapers (Jang, Nawa-i-waqt, and Roznama Express) and three English language one's sunrise, The news and the state. They hooked up that media reports of CPEC majority of Pakistani media stated at the monetary gain. therefore, Infrastructural development, job introduction, country wide protection and country wide prosperity are news worth whilst the environmental costs associated with the mega development initiatives receives reported very much less. ought to there be extra qualitative research to study whether diversionary reframing is intentionally used by the media or whether geopolitical and the economic improvement frames of cognizance constitute unconscious, reflexive frames that reporters visit when writing approximately mega-initiatives in a growing countries context?

BRI and CPEC, not notably, are Chinese language flagship projects attracting constant interest from researchers throughout the disciplines. BRI includes a number of the Asian international locations that are seemed to be the hub of the worldwide economic market, and the mission is meant to attain Africa and EU markets. sooner or later, the SAARC members are all below the BRI umbrella however for India that has some reservations (Ahmed, 2019). The BRI has several corridors, whilst the significant and working task is the CPEC which connects the Pakistani province Baluchistan and the Western province, Xinjian of China via roads, railways and pipelines worth about 62.01 billion USD (Das et al., 2017). It became whilst the Chinese language president Xi Jinping and Pakistani high minister Nawaz Sharif collectively with provincial chiefs assembled for the “street and belt summit” in 2017 in Beijing, that it started out to take off (Chawla et al., 2020). CPEC is a multi-sectoral assignment alongside the Western coast of Gwadar, Baluchistan linking all of the provinces of Pakistan with street, pipes, railway tracks, strength centers and commercial initiatives and the rest of the sub-initiatives in conversation, health, education and transportation (Kanwal et al., 2020).

The undertaking may even empower Pakistan to develop its strength resources whilst on the CPEC course (Iqbal et al., 2019) and could be prolonged to other countries, which includes Afghanistan and other vital Asian nations. 3 proposals of routes are supplied for CPEC in Pakistan: while the eastern path will journey normally via Punjab and Sindh Provinces (Irshad, 2015), the second one, which is called the principal route, will cover most a part of Khyber Pakhtunkhwa and underdeveloped areas in Punjab and Sindh Province. The 0.33 western direction goes through rural parts of Baluchistan with Khyber Pakhtunkhwa (Zingel et al., 2015). The CPEC venture is a manufactured from consider relations, and commonality of both parties' wondering. for the duration of tough times, Chinese government gave support to the government of Pakistan, greater so, whilst Pakistan became underneath strain from the international network after the nuclear test and other missile programs (Wolf, 2021). within the latter a long time of the twentieth century, China took a neutral stand on many worldwide fronts, and that facilitated its advanced monetary and technological increase. the second decade of the 21st century proven to the complete global that the united states changed into a notable electricity playing the role of an international participant, tying several countries to the internet of economic and technological members of the family, organizing friendly members of the family inside the form of nonviolent on the part of China.

Its miles believed that the CPEC project is worthwhile for the local community (Asomani et al., 2015). monetary impact refers to such economic benefits as earning opportunities, employment, change and different form of finance gains, which the mission will deliver to local population. Perceptions of the local people with regard to CPEC can be both for or towards the predicted blessings. Others view the venture in a pessimistic manner and bear in mind the task to have bad effect on their community and local enterprise (Ali et al., 2017). The CPEC is a multi-area mega-mission with billions of bucks invested in roads/toll road constructions, railway tracks and device, telecommunications, infrastructural development, and different approach of transportation that are probably to create loads of heaps of jobs, specific markets for items and offerings, logistics and materials chains of valuable products to all of the community with low attempt and cost. It became additionally reiterated that local citizens will get hold of their deserved blessings in terms of sophisticated agricultural products, boom of small and medium-length businesses including workshops, lodges and eating places, storages, petrol pumps and parking centers (Gursoy et al., 2017). Similarly, the infrastructure improvement has a near dating to agricultural output. Infrastructure investment is subsequently transformed to agricultural output (Evenson et al., 2001).

The unemployment scenario in Pakistan is becoming worse every day because of population propagation and plenty of untapped sources, which brings with its poverty, hunger, and social exclusion (Haq et al., 2016). In those perilous conditions the CPEC might also come to be a boon for employment introduction, and sustainable and distinctive financial boom of Pakistan. in advance studies recognized that the CPEC will sharpen sales and facilitate the formation of financial zones, and fuel tourism improvement which upon the only hand will reinforce neighborhood community, but however will trade taking into consideration local population to the success of this venture (Nunkoo et al., 2012). The monetary outcomes could confer greater recognition for any international venture and it's far proper to see it as the important thing riding pressure for justification and approval. on this regard, the contemporary

study indicates that the greater could be the financial effect, the greater may be the help of the nearby population for the CPEC challenge. that is, therefore, hypothesized (Ali et al., 2017). the opening up of infrastructure and consequent increase in the agricultural output will also cause introduction of jobs in the rural areas and, consequently, make contributions to the development of the rural economic system.

Social impact is the effect of CPEC on social interactions and social concord, that is, social well-being of any society, which is typically expected through education, health, housing, and other centers that represent commonplace guys' want in any society (Haq & Farooq, 2016). The CPEC development is expected to fuel own family life, schools, social gatherings, social establishments and all other social contracts. Rafiq & Weiwei explained the social trusts which encompass behavior, wondering and enthronement of living requirements which provided a modern notion of the CPEC venture in Pakistan (Rafiq & Weiwei 2017). previous research mentioned many superb consequences of the CPEC on society, inclusive of possibilities for coming into markets; educational networks and social interactions; narrowing of social breaks and divisions, and; specifically, resolving social exclusion (Kanwal et al., 2020). The society as an entire maximum especially the rural regions turns into the centre enterprise and social engagements due to the economic and trade spill over from China. those are the symptoms of social prosperity; improvement in healthcare and smart towns/towns (Asomani et al., 2015). Socially the human beings-to-humans exchanges, subculture events and country wide days of birthday party of both international locations may also announce a new era of friendship and relations (Geurs et al., 2009). The CPEC initiatives will set off new thinking into the rural regions thereby pushing the nearby populace with the challenge. This have a look at is constructed on the idea that the local community could be equal to maintain to guide the CPEC initiatives, thinking the venture is a street for social uplift.

The host communities' lifestyles trendy is greatly inspired through the social and cultural changes multiplied via overseas works (Ali, et al. 2017). The neighborhood way of life is open to new fine modifications with traits in infrastructural and traveler enchantment factors. it is possible that the CPEC course might also allow social interactions among various communities so that it will of their personal part; create new cultural exchanges and activities (Asomani et al., 2015). the approaching cultural modifications that will floor from CPEC can be anticipated with the aid of improving near ties among diverse households, pals, and friends (Ali et al., 2018), and that is why perceptions of local resident's help increase regulations that lessen the detrimental consequences of the CPEC (Kanwal et al., 2020). global tasks (CPEC as an example) have a terrific have an impact on at the tradition of the host network. Such mission ends in excavation and discovery of latest historic websites, facilitate archeological sports and studies, creates possibilities of cultural change, and develops museums and libraries for cultural artifacts. Such trends will add to leisure and enjoyment facilities to be able to serve to assist the CPEC inside the minds of the local community. a few authors cited how new cultural values should come up, which won't correspond with the fee of neighborhood lifestyle within the context of traditional and non-secular values; due to the fact that, a number of the locals can also trust that the CPEC is a danger and a tool of Chinese language cultural hegemony. Those CPEC street and transportation routes can boost up the flow of goods and services, in addition to turn out to be a device for changing social customs, dissemination of languages and ideals

etc., amongst others. But, according to the SET cause, the area people will factor to the advantages of such tasks. consistent with the above said researcher's paintings, we are able to assume that the CPEC is useful for the local community, so the notion of this project may be favorable, and local communities will aid the mission.

2.1 Research Hypothesis

RH 1: Consistent exposure with social media apps creates negative effects on individuals' perception about CPEC.

RH 2: Social media users have strong belief about information provided through online resources.

RH 3: Social media users who follow political leaders are more likely to hold negative misconceptions about CPEC.

RH 4: Social media campaigns by foreigner's boost misconceptions about CPEC being a debt trap, influencing public trust in Pakistan.

2.2 Theoretical Framework

2.2.1 Intended Theory

The theory is a concept developed through George Gerbner at some point of the 1960s and 1970s and it's been challenged in view that each media technological improvement. The past sixty years have visible the mass conversation subject enjoy propagation of cable, satellite, video games and extra currently, social media. Up to this point the theory has managed to survive by constant correction and improvement. More than 120 studies supported the theory since 2000, highlighting its relevance for the constantly changing trends in the media sphere. The concept discussed in this study originates and considering that, its development and expansion and destiny possibilities. inside the first a part of the paper, a top-level view is supplied of the idea / foundation ideas of the theory. After, there's presentation of the introduced additives into the principle and their development over the past 6 decades together with: The cultivation analysis, the conceptual dimensions of cultivation, styles of cultivation and the way cultivation is measured, and the crossing of the borders to revel in cultivation. each section is accompanied by way of a discussion on the capacity of the principle to house changes inside the media setting with regards to present day emphasis inside the media sectors (Gerbner 1960). The reason why I choose cultivation theory is because it molds long term public perception, however this theory is concerned with the long-term effects incoming from television contact while I considered effects that social media has on human minds.

3. Methodology

For the analysis of Impact of Social Media Misinformation on Public Trust in CPEC A structured questionnaire design for the assessment of communication pattern between Social media and public trust. Data were collected with the help of questionnaire; 300 participants provide their data by filling the form. It includes demographic questions about their duration of media use, social media, why they use social media, their attachment with this mega project etc. We target the university students. Likert-scale items were also included in it. Data collected by spreading the questionnaire through online platforms mainly by Google forms spread

through WhatsApp and after collecting the data were statistically analyzed using SPSS software to determine accurate results. Through SPSS descriptive statistics, Anova formulas are used. Ethical guidelines were followed like informed consent and confidentiality.

4. Data Analysis

Table No 1: Age

	Frequency	Percent	Valid Percent	Cumulative Percent
btw 15-18	58	19.3	19.3	19.3
btw 18-20	50	16.7	16.7	36.0
btw 20-22	131	43.7	43.7	79.7
btw 22-25	59	19.7	19.7	99.3
other	2	.7	.7	100.0
Total	300	100.0	100.0	

Table 1 is the age of respondents. First, the respondents are composed by the majority (43.7 %) who are 20 – 22 years old. Youthful demographic is denoted by this percentage (19.7) % of respondents fall in 22–25-year age bracket and form the second largest group. The third group would be with respondents of 15 – 18 years of age; this is equivalent to (19.3) % of respondents. 50 individuals (16.7%) would form a moderate piece between 18 and 20 and 0.7% who may exceed 25 or less than 15 years old.

Table No 2: Study Level

	Frequency	Percent	Valid Percent	Cumulative Percent
Matric/Intermediate	85	28.3	28.3	28.3
Undergraduate (BS)	70	23.3	23.3	51.7
Graduated	107	35.7	35.7	87.3
Post-Graduate (PHD)	35	11.7	11.7	99.0
Other	3	1.0	1.0	100.0
Total	300	100.0	100.0	

Table 2 presents the spread of the level of education for the 300 participants. Of course, the large group is graduates, 35.7%, under graduation – 23.3%, Matric/intermediate – 28.3%, post graduate groups – 11.7%. The people surveyed have quite varied educational backgrounds. This distribution will be used to determine the contribution education made when discussing the impact of social media misinformation and public trust on CPEC.

Table No 3: Place of Residence

	Frequency	Percent	Valid Percent	Cumulative Percent
Rural	87	29.0	29.0	29.0
Urban	186	62.0	62.0	91.0
3.00	26	8.7	8.7	99.7
5.00	1	.3	.3	100.0
Total	300	100.0	100.0	

Table3 describes the place of residence of the respondents. There were 300 subjects wherein subjects under the rural and area group (n = 103, 29%), and subjects under the urban

area group (n = 197, 62%) participated. This study stood for people both from Urban and rural areas, and this study also cemented our thought process on how people from various area respond to the information of CPEC. The research also guarantees variety of backgrounds providing opinion in the study. This data also helps us understand what occurs among the people of urban and rural areas when exposed to CPEC related information.

Table No 4: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
How much time do you spend on social media apps daily?	300	1.00	3.00	1.4300	.50260
which social media platform do you use the most?	300	1.00	4.00	2.1600	.82259
What is your primary purpose for using social media?	300	1.00	4.00	2.2633	1.12764
How often do you encounter misleading or fake information on social media?	300	1.00	4.00	2.4067	.96144
Do you think social media affects your mental health?	300	1.00	4.00	2.4167	.95188
Valid N (listwise)	300				

Table 4 provides descriptive statistics for five survey questions concerning social media use and attitudes, all having been answered by 300 respondents. The first variable “How a whole lot time do you spend on social media apps day by day” demonstrates that the measure of the daily usage of the social media range from no less than 1.00 to a most of three.00, an average of 1.43 and a fashionable deviation of 0.50. which means on common, respondents have a fair amount of time to spend on social media, with maximum of the responses held on the decrease end of the dimensions. the solution to the query, “which social medium do you use most”, the answers went from 1.00 to 4.00, with a median of two.16 and fashionable deviation of 0.82 indicating mild variability on desired platform. The primary purpose for using social media also varied from 1.00 to 4.00, the mean was higher, at 2.26, and the standard deviation (1.13) was higher, suggesting greater diversity of reasons for use. Concerning the share of respondents who sometimes find themselves exposed to misleading or fake information, both means: for the more straightforward question about the frequency of mis- or non-information (2.41, SD = 0.96) and a similarly rounded mean for the same kind of question, but on the topic of the influence of social media upon mental conditions (2.42, SD = 0.95) indicate that people are not afraid of it all that often, but the opinions are relatively dispersed. Overall, the results show that this sample generally displays moderate social media engagement and awareness of such with moderate variation of experiences and perceptions.

4.1 ANOVA

RH 1: consistent exposure with social media apps creates negative effects on individuals' perception about CPEC.

Table No 5: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.249 ^a	.062	.059	1.06297

a. Predictors: (Constant), How much time do you spend on social media apps daily?

The model summary table shows some main results from a regression analysis that looked at how much time people spend on social media apps each day. The correlation coefficient (R) is 0.249, which means there is a very weak, simple, and positive connection between how much time people spend on social media and the results in the dependent variable. The R Square value is 0.062, which means that the amount of time someone spends on social media only explains about 6.2% of the ups and downs seen in their stress level. The Adjusted R Square is slightly lower at 0.059, which means that having more predictors has lowered the value and gives us a more accurate idea of how much of the total variation in the data is explained by the model. The standard error of the estimate is 1.06297, which shows how much on average the actual numbers differ from the trend line. a larger value means the predictions are less accurate. Overall, this model only helped to explain a small part of how people score on the dependent variable, so spending more time on social media each day doesn't give us much clue about how high or low a person will score in this analysis.

Table No 6: ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	22.202	1	22.202	19.649	.000 ^b
	Residual	336.715	298	1.130		
	Total	358.917	299			

a. Dependent Variable: How often do you consume content related to CPEC on social media

b. Predictors: (Constant), How much time do you spend on social media apps daily?

The sum of squares is divided by their degrees of freedom to find the mean squares. For regression, the mean square is 22.202, and for the residuals it is 1.130. The F-statistic value (19.649) compares mean square regression to mean square residual to find out if the model accounts for significant more variance than the mean does. Since our p-value is .000, it indicates that the time someone spends on social media significantly leads to increased CPEC-related content consumption. All things considered; the regression model provides a much better way to forecast the average number of actions taken with CPEC than just using the mean.

Table No 7: Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.008	.185		10.833	.000
	How much time do you spend on social media apps daily?	.542	.122	.249	4.433	.000

a. Dependent Variable: How often do you consume content related to CPEC on social media

The coefficients table provides evidence about the relationship between daily time on social media apps and how often CPEC content appears on one's news feed. This means that when a person does not use social media, they will consume an average of 2.008 units of content. The amount people increase their CPEC content consumption when spending more time on social media is 0.542, with a standard error of 0.122. Beta shows a moderate effect size of 0.249 in this case. Since the t-value is 4.433 and the significance level is 0.000, we can conclude that the relationship is significant at the 0.001 level, and the predictor variable helps reliably predict the outcome variable. People who spend more time on social media per day are more likely to see more content about China-Pakistan Economic Corridor.

4.2 Findings and Discussion

In this chapter, focus is put on how social media misinformation affects public trust of Pakistani youth in CPEC. This study aims to provide insights to better understand how false and misleading information on social media platforms is shaping perceptions of this national development component among the university student populace. A questionnaire survey was prepared to gather information related to the experiences and perceptions of the participants regarding the misinformation and a random sample of 300 participants was taken from different sectors of the university in Pakistan. They find major roadblocks in information verification, widespread exposure to misleading content and changing spheres of trust as to CPEC and China Pakistan relations (Ejaz & Ittefaq 2020; Mir & Siddiqui, 2022).

According to the research, at least 63% of university students in Pakistan come across some type of online disinformation one or multiple times a day, and 81% believe that social media websites are most likely to venture out with misinformation. Then, because of this high exposure rate to questionable information, it is hard to form informed opinions about such important national projects as CPEC (Ejaz & Ittefaq, 2020). According to Roas (2022), Facebook was allegedly the most vulnerable social network among surveyed youth, as approximately 70% of them considered it the weakest with regards to false messages regarding CPEC related information.

The main objective of conducting this research was to assess the association between social media misinformation and public trust in CPEC among Pakistani youth. With the prevalence of misinformation of digital platforms, it is important to understand how the same hinders the perception of major developmental initiatives. The objective of this study is to

observe the consumption patterns of misinformation, the spread of false narratives about CPEC over different social media networks, and how they have affected the trust levels of young Pakistanis (Aslam et al., 2020. Shaheen, 2022).

As approximately 35% of the population in Pakistan is under 15 and 64% is under 30, young people are the main audience (and stakeholder) for these long term benefits of CPEC (Tariq et al., 2023). According to previous research (Aslam et al., 2020), the baseline perception towards CPEC is generally positive with 72 percent of respondents thinking that it will be a beneficial endeavour for Pakistan.

The findings in this study show that misinformation exposure impacts the Pakistani youth's perception of CPEC in various ways. Although participants continue to have optimistic views of CPEC as beneficial to Pakistan's economic development and its regional position (Ejaz & Ittefaq, 2020 ; Aslam et al., 2020).

Several prevailing misinformation narratives about CPEC have also been identified through the research to be currently circulating on social media platforms such as; exaggerated claims of job creation, false claims of Chinese debt traps, and false narratives of CPECs environmental impacts (Rosas 2022;. Tariq et al., 2023). However, most of the respondents demonstrated resilience in sustaining their trust in the wider benefits from such a project (72% of the respondents expressed confidence that CPEC would improve the economy and infrastructure of Pakistan; Aslam et al. 2020).

The possibility of resilience exhibited in this case is in association with 55% of respondents' descriptions of China–Pakistan friendship as 'Interest based', implying that warmth and affection of Pakistani youth about China are based on pragmatism and not any emotional attachment (Mir & Siddiqui, 2022). Applied as a pragmatic approach, this could act as a deterrent against the emotional appeal repeated in misinformation on CPEC (Mir & Siddiqui, 2022).

5. Conclusion

This study found critical insights into the association between social media misinformation and the public's trust in CPEC amongst Pakistani youth. However, the research confirms that the prevalence and acknowledgement of misinformation as a problem has not significantly impeded the positive overall perception of CPEC by educated youth. But there is a significant vulnerability still to exploit as the gap between what people are aware of as misinformation and what they are actually doing to verify the information is still a major gap. By contributing to the body of literature that examines how misinformation influences public opinion regarding the implementation of the major development initiatives, this research sets the stage for more studies in the field of information reserves relating to partnerships at the international level. With Pakistan continuing its relationship with China through the CPEC, it will be very important for Pakistan to understand and attend to the misinformation landscape, if they want public support for the project to continue and stay successful (Mir & Siddiqui, 2022).
